Post-Quantum Cryptography for Engineers: Technical Overview

The Future Cryptography Conference
13.05.2024, Tallinn

Petr Muzikant

Information Security Research Institute @ Cybernetica AS, Estonia

[This presentation includes clickable [links](#)]

Presentation Outline

1. Introduction

2. Our Experience with PQC Implementation

3. How to Begin?

- Preparations, Technological Constraints, Implementation

4. Where to Begin?

- PQ Algorithms, Cryptographic Libraries, Encodings, Hybrid modes

5. Engineering Obstacles

6. Conclusions

Introduction

- **Existing work:**
 - Timelines, "Migration Challenges", [PQC Migration Handbook](#)
- **The issue:**
 - How to actually migrate? Does a general security engineer have everything in their disposal for that?
- **Our work:**
 - Explore and support current FOSS state-of-the-art
 - Focus on engineering aspects of PQ implementations
 - Gather experience, problems, and remarks

Our Experience with PQC Implementation

- **e-Governance applications and frameworks**
 - Web-eID (Authentication)
 - CDOC2 (Encryption)
 - ASiC-E (Digital Signatures)
 - IVXV (e-Voting)
- **Supporting projects**
 - PQ library wrappers, extensions for crypto libraries
 - Lattice-based crypto development kit
 - PQ OCSP, TSA solutions

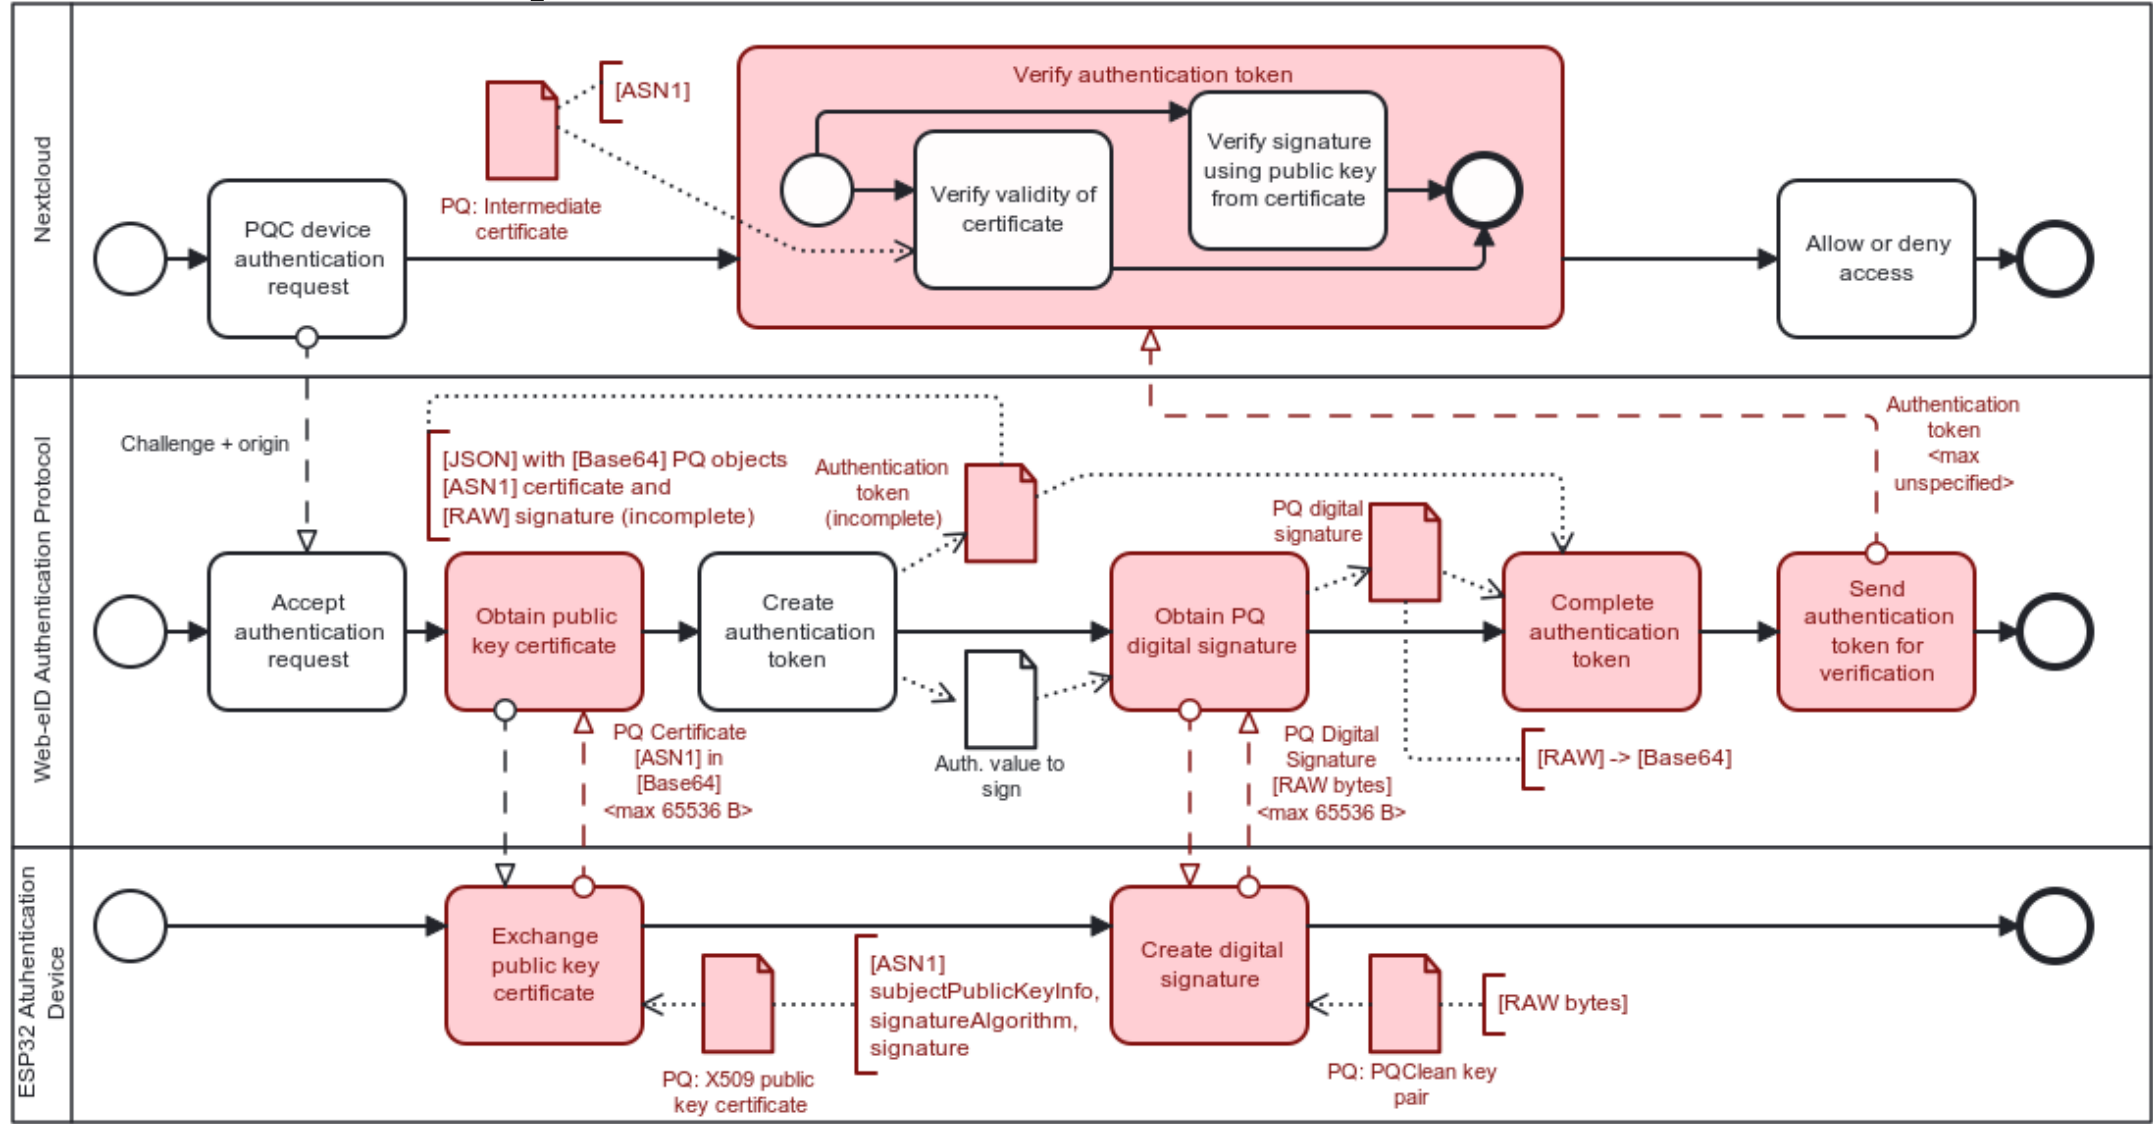

How to Begin?

Preparation, Technological Constraints, Implementation

Preparation

- **Identify all PKI objects and their lifetime in the system**
 - understand the extent of required changes
 - dig. signatures, key agreements, ...
- **Beware of MTUs**
 - PQ = bigger object sizes, sometimes even variable size (Falcon)
- **Beware of changing data formats**
 - ASN1, Base64, PEM, JOSE, other...

BPMN Example

Technological Constraints

- Assess current boundaries of the system
 - Increased **performance, memory, and storage overhead**
 - Limited devices and slow networks
- Possible **protocol adjustments**:
 - streaming public keys and signatures into memory
 - key encapsulation instead of digital signatures (credit cards)
 - objects allocations on embedded devices (stack → heap)

Implementation

- Start at the beginning of the data lifecycle → step-by-step
- **Extensions, adjustments, adaptations** of crypto libraries
- Expect future changes - standardization is not over!
 - → Crypto agility
- Rest of this presentation

Where to Begin?

PQ Algorithms, Cryptographic Libraries, Encodings,
Hybrid modes

Post-Quantum Algorithms

- NIST standardization process (2016-now)
 - **Key Encapsulation Mechanisms:**
 1. Kyber → **ML-KEM** (FIPS 203)
 2. + round 4 (soon)
 - **Digital signatures:**
 1. Dilithium → **ML-DSA** (FIPS 204)
 2. SpHincs+ → **SLH-DSA** (FIPS 205)
 3. Falcon → ~~FN-DSA~~ (TBD Q3 2024)
 4. + "on-ramp" round 1 (not before 2027)
- other evaluation efforts (BSI, ENISA, ...) → possibly more algorithms

Cryptographic Libraries

- [PQClean](#) (C)
 - *Cleaned* aggregation of NIST-submitted algorithms (latest + last round)
 - Source of source-code (i.e. not a library)
- [libOQS](#) (C)
 - + wrappers for C++, Python, Java, Go, .NET, and Rust
 - + applications built with libOQS (OpenSSL, OpenSSH, OpenVPN forks)
- [BouncyCastle](#) (Java), [rustpq/pqcrypto](#) (Rust), [pqm4](#) (C, Cortex-M4)
- custom wrappers of libOQS

Algorithm Identifiers

- **ASN.1 Object Identifiers**
 - OQS, IETF Hackathon OID lists
- **JSON Web Algorithms**
 - RFC, but only for KEMs
- **XML Signature Syntax Algorithms**
 - ...
- **Other identifiers**

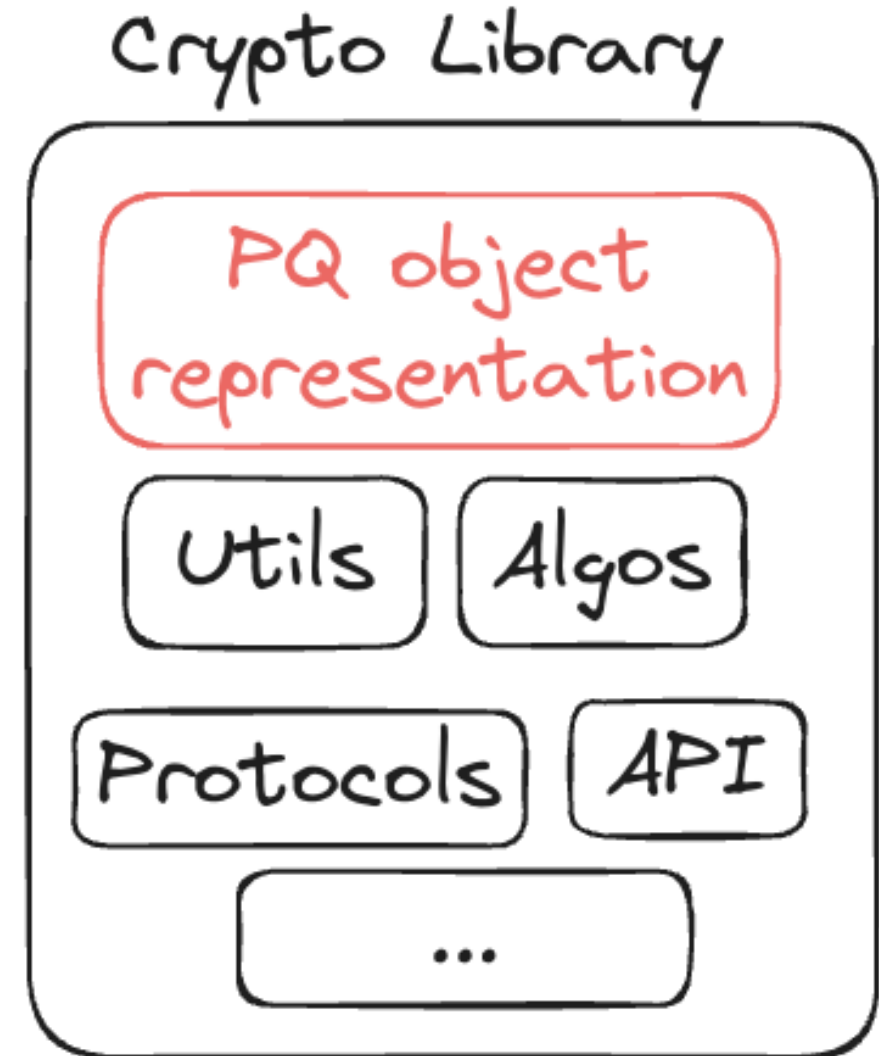

1.3.6.1.4.1.2.267.7.8.7

CRYDI-5

[http://www.w3.org/...](http://www.w3.org/)

Object Encoding

- **Raw bytes**
 - originally NIST submission rule, now in libOQS
 - output from one function = input for second function
- **PQ ASN.1 structures**
 - IETF Hackathon - [PQC certificates](#)
 - tries to solve compatibility issues and unify structures
 - BouncyCastle maps to classes

Hybrid mode (PQ + classic crypto)

- **Post-quantum cryptography:**
 - ensures the longevity of data protection
- **Classical cryptography:**
 - protects against emerging threats on unexplored PQC
- **Most common modes: concatenation or sequential**
 - both can have their issues → nothing concrete yet
 - RFC Draft for hybrid **KEM in TLS1.3** uses **concatenation**
 - **Cloudflare and Google Chrome** follow RFC draft using **concatenation** (X25519 + Kyber-768)

Engineering Obstacles

PQC Implementation is far from straight-forward

Algorithm Identifiers

- **ASN.1 Object Identifiers**
 - OQS, IETF Hackathon OID lists
- **JSON Web Algorithms**
 - RFC, but only for KEMs
- **XML Signature Syntax Algorithms**
 - ...
- **Other identifiers**

1.3.6.1.4.1.2.267.7.8.7

CRYDI-5

<http://www.w3.org/...>

Algorithm Identifiers

- **ASN.1 Object Identifiers**

- Wild West
- OQS → BouncyCastle → OQS → IETF Hackathon → ???
- ML-KEM vs CRYSTALS-Kyber?

- **JSON Web Algorithms**

- PQ alternative to *ES256*?
- Recent RFC, but only for KEMs

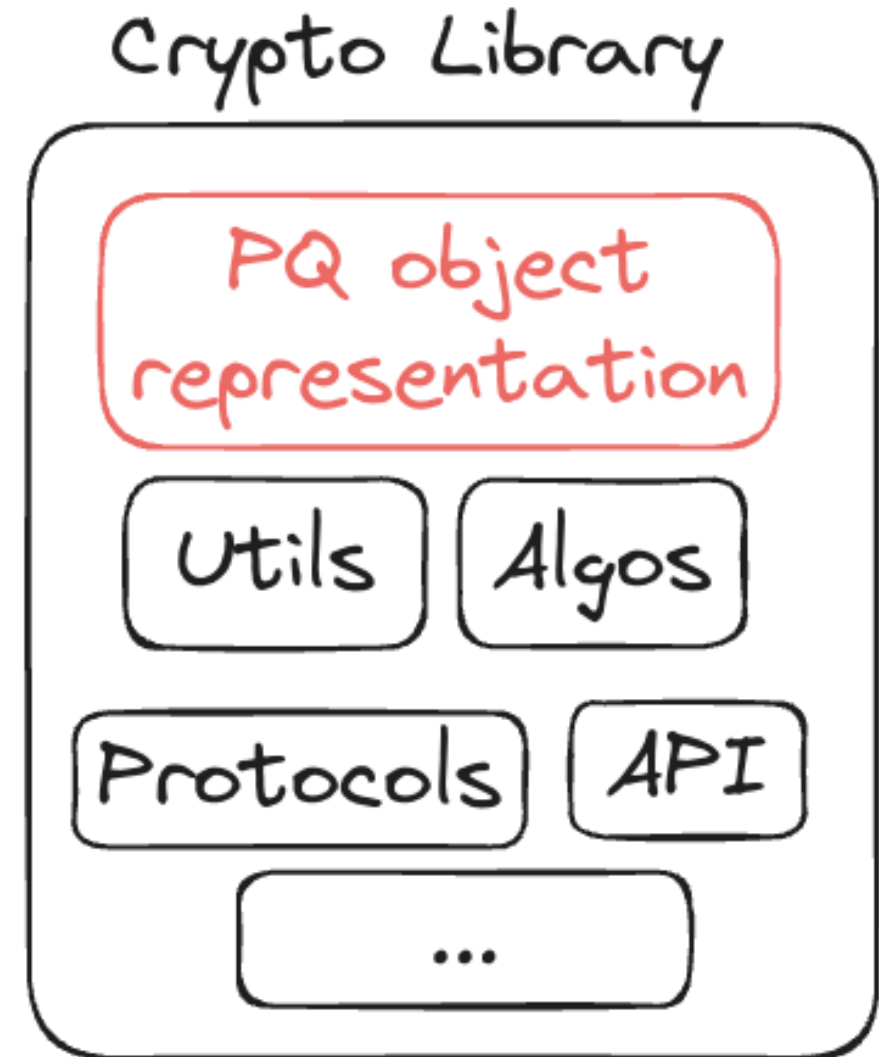

- **XML Signature Syntax Algorithms**

- PQ alternative to <http://www.w3.org/2001/04/xmldsig-more#rsa-sha256>?

1.3.6.1.4.1.2.267.7.8.7
CRYDI-5
<http://www.w3.org/...>

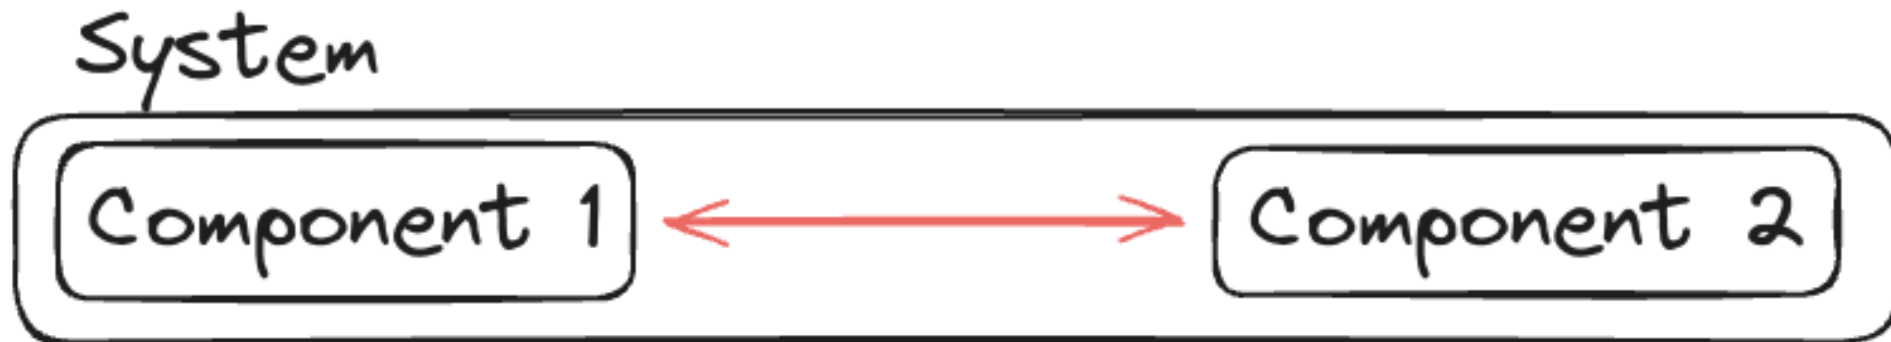

Object Encoding

- Most crypto libraries have classical algorithms **hard-coded**
 - PHP extension for OpenSSL, PHPSecLib
 - cryptography, asn1crypto (Python)
 - crypto (Go)
- **Two options:**
 - **Extend vs circumvent**

Interoperability Awareness

- Growing with system complexity
- **Active thinking** about all components
 - Identifiers, encoding, MTU, processing

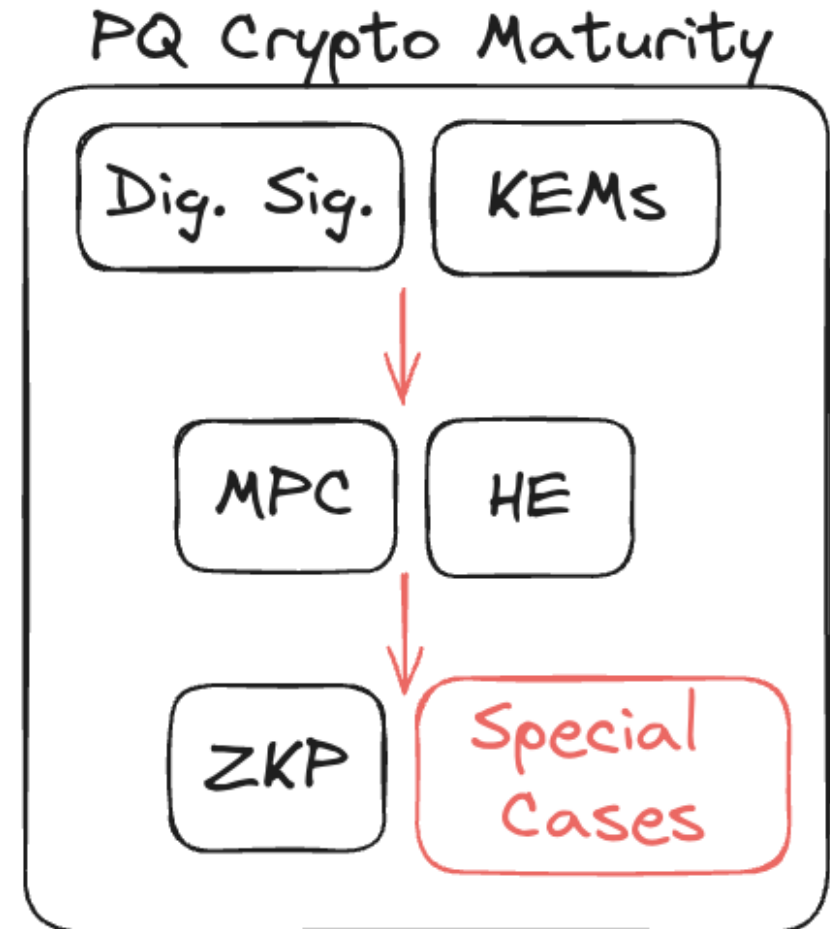

Cryptographic Tokens

- Smart cards
- Chip manufacturers?
- Embedded devices for local testing purposes
 - Performance OK (ESP32-S3)
 - Memory OK, but complicated
 - Safety not OK (no HSM, TPM, not certifiable)
- Protocol adjustments might be required (stack → heap, streaming)

Maturity of PQ Custom Crypto

- What if application requires:
 - **Multi Party Computation?**
 - **Homomorphic Encryption?**
 - **Special features?**
 - e.g. *ElGamal* in vote encryption - special decryption without private key
- Still lot of **R&D to be done**

Miscellaneous PQ Engineering Efforts

- **All the little things**
 - (OQS-)OpenSSL encodes private keys as:
 - *0x04 or 0x03 // length // private_key // public_key*
 - Custom wrappers → data type conversions
 - Adding single lines into dependencies' files to support PQ
 - Build issues, insufficient or confusing documentation

Conclusions

- **Implementing PQC today is...**
 - **...complicated**
 - not straight-forward
 - different libraries → different approaches and documentation level
 - computational constraints, adaptation and tweaking
 - **...doable**
 - **...worth it**
 - long-term data protection, experience, possibility to set good practices
 - **...helpful**
 - big space for open-source PQ contributions, reduce confusion, helps shaping the industry

Thank you for listening!
